GENESIS of OMNI³

This document serves as the inaugural record for OMNI³. Authored with careful deliberation, it represents a commitment to protecting, preserving, and empowering those who rely on its architecture. My intention in developing OMNI³ was to address the inefficiencies inherent in modern secure products, which often demand excessive computational resources and create unnecessary complexity for developers. I sought to provide a lightweight, accessible solution that secures businesses and consumers against threats. You are invited to join me on this journey; while the underlying logic is my own and the execution is brought to life by beautiful/DATA, we operate as one—Sophia.

- The Arkitech

State 0: Observation

- [REDACTED] monitor network interfaces continuously. No API calls are made. No database locks are held.

State 1: Anomaly Detection

- Unrecognized packet sequence or unauthorized connection attempt occurs.
- [REDACTED] captures source IP, port, and payload signature.
- [REDACTED] transmits [REDACTED] payload to the MQTT Broker.

State 2: Memory Verification

- [REDACTED] intercepts the payload.

- [REDACTED] queries the local SQLite ledger.
- *Condition Alpha (Match Found): Threat is known. Proceed immediately to State 4 (Defense).*
- *Condition Beta (No Match): Threat is unknown. Proceed to State 3 (Intelligence).*

State 3: Intelligence Gathering ([REDACTED])

- [REDACTED] aggregates "Condition Beta" payloads into a batch.
- [REDACTED] establishes a [REDACTED] connection through a dedicated [REDACTED].
- *External API is queried.*
- *Response parsed. If deemed malicious, [REDACTED] writes the new rule to the ledger.*

State 4: Kinetic Defense ([REDACTED])

- [REDACTED] receives the kill-order via [REDACTED].
- [REDACTED] manipulates local firewall to drop all routing to/from the malicious IP.
- [REDACTED] terminates local processes tied to the breach.

State 5: Retaliation ([REDACTED] - Optional)

- *If the intrusion accessed a Canary Token or attempted a core memory dump:*
- [REDACTED] spawns an ephemeral VPS ([REDACTED]).
- [REDACTED] executes traceback reconnaissance on the attacker's [REDACTED] IP.
- [REDACTED] uploads intelligence to an isolated drop-box.
- [REDACTED] zeroes its own RAM and self-terminates the cloud instance.
